Fuel EKG™

Powered by MOTORQ

Intelligent, intuitive fleet fuel management

Fuel is the **largest vehicle-based per-mile cost** for fleets and can represent up to **60%** of fleet operating costs. What would a 5-10% reduction in fuel costs mean to your business?

Fuel EKG connects OEM enabled vehicle/device data and standard fuel card transaction data to deliver insights that can help eliminate fuel card misuse and reduce fuel costs. These insights are delivered where you need them, via email or a designated portal.

Fuel EKG detects four different types of exceptions that may indicate fuel misuse:

LOCATION MISMATCH   **CARD MISMATCH**   **EXCESS VOLUME**   **FUEL TYPE MISMATCH**

For more information, contact your Element account manager or visit elementfleet.com

HOW IT WORKS:

The check for an exception starts when a fuel transaction is recorded by the fleet's fuel card provider. Fuel EKG takes this data and compares it to the connected data from the vehicle to check for the four exceptions.

Location mismatch – At the time of the fuel transaction, where was the vehicle linked to the card?

Card mismatch – At the time of the fuel transaction, was a different vehicle filled with the assigned card?

Excess volume – Was the quantity of gallons pumped greater than the available capacity of the tank?

Fuel type mismatch – Was the type of fuel pumped the same as the vehicle's type of fuel?

Fuel EKG provides complete coverage of fuel misuse identification by blending connected vehicle data with fuel transaction data to provide you with a comprehensive view of fuel misuse to track and reduce fuel costs.
